

This guide was updated on Feb 8th, 2024. Read it carefully because things may have changed from when you last read it.

If needed, you can ask for assistance in the [ReVanced Discord](#), [Subreddit](#), or [Telegram](#).

Client ID Setup

Go to [this page](#) (and sign in to the account you want to use).

Select, “are you a developer? Create an app”.

- Enter an app name (it doesn't matter what you call it).
- Set the type to “**installed app**”.
- For Sync, set the **redirect uri** to “ **http://redditsync/auth** ”

For Boost, set the **redirect uri** to “ **http://rubenmayayo.com** ” (Many users experience rate limits while using patched Boost.)

For RIF (Reddit is Fun), set the **redirect uri** to “ **redditisfun://auth** ”

For Relay, set the **redirect uri** to “ **dbrady://relay** ”

For BaconReader, set the **redirect uri** to “ **http://baconreader.com/auth** ”

For Infinity, set the **redirect uri** to “ **infinity://localhost** ”

For Slide, set the **redirect uri** to “ **http://www.ccrama.me** ”

For Joey, set the **redirect uri** to “ **https://127.0.0.1:65023/authorize_callback** ”

d) Press, “**create app**”.

The screenshot shows the 'create application' form. It includes a title 'create application', a disclaimer about terms, and several input fields. Red boxes highlight the 'name' field (containing 'Boost Example'), the 'installed app' radio button, the 'redirect uri' field (containing 'http://rubenmayayo.com'), and the 'create app' button. A red arrow points to the 'create app' button.

create application

By creating an app, you agree to [Reddit's Developer Terms](#) and [Data Api Terms](#). You must

name Boost Example

☐ web app A web based application

☒ installed app An app intended for installation, such as on a mobile phone

☐ script Script for personal use. Will only have access to the developers account

description

about url

redirect uri http://rubenmayayo.com

create app

Now copy the client ID, which is directly under the app name. Save it in your clipboard. You'll need it soon.

developed applications

Example
installed app
2MF2...6kQow

change icon

name

description

about url

redirect uri

Patching Setup

Uninstall the official version of the app you are going to patch. (Example: If you have Sync installed, and are about to patch Sync, uninstall the Sync app.)

You may want to export the settings configuration from your reddit client app before uninstalling.

Install (or update to) the [latest version of the ReVanced Manager](#).

Download the APK

Do not install the APK after you download it!

[Sync download](#)

[Boost download](#)

[Relay download](#)

[Reddit is Fun \(RIF\) download](#)

[BaconReader download](#)

[Infinity download](#)

[Slide download](#)

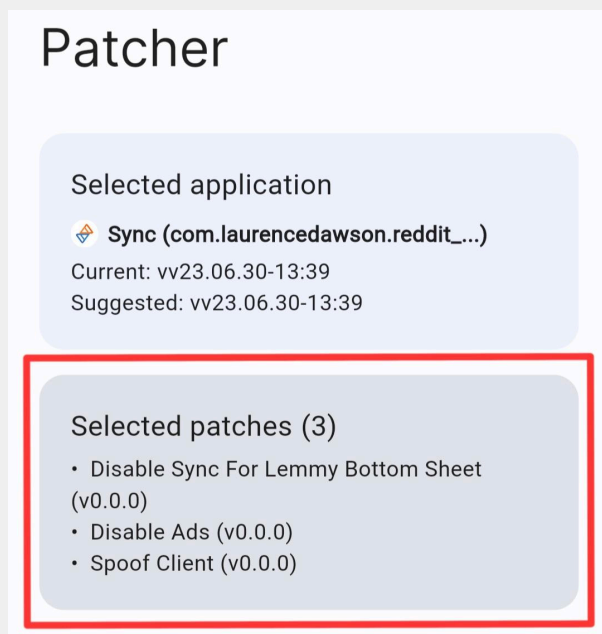

[Joey download from apkmonk.com](#) (If you use the [latest version](#) there will be a popup that will only stop appearing after you click on "[Learn More & Register](#)")

Do not install the APK after you download it!

Open the Manager > Patcher > Select an application.

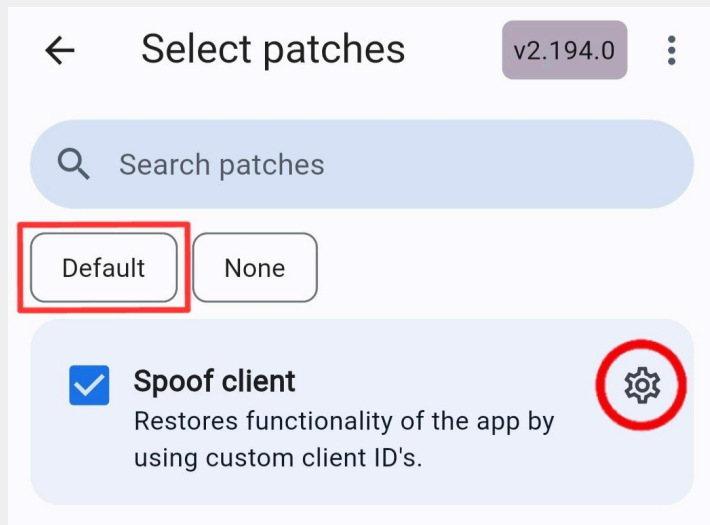

Press the **"Storage"** button and then select the APK file that you downloaded.

Tap on the **"Selected patches"** card.

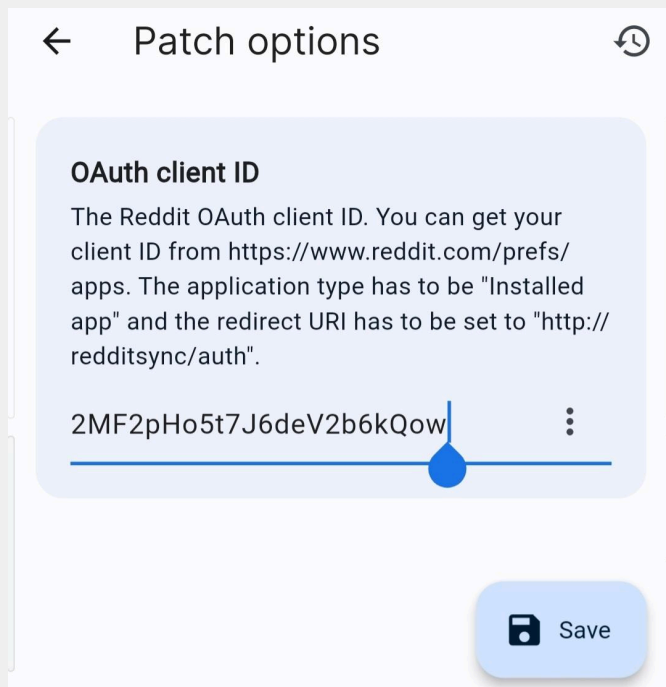

(Most Reddit clients only have the Spoof Client patch.)

Tap on the **"Default"** button and then press the gear icon by the Spoof client patch.

Enter the client ID that you copied earlier and then press **“Save”**. Make sure there are no extra spaces.

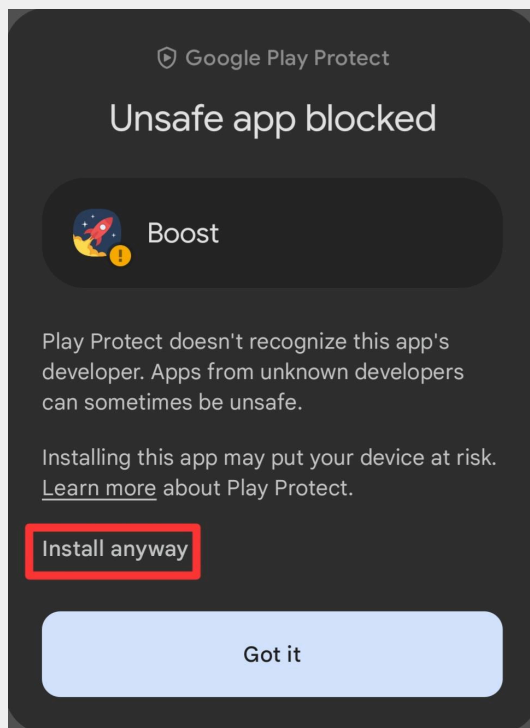

Press **“Done”** and then **“Patch”** and wait for it to finish.

(optional) If you want to save or share the patched APK file, you can export it by using the save button in the bottom left corner.

Install the patched APK.

If you get a pop-up from Google Play Protect while installing, press “**More details**” and then press “**Install anyway**”.

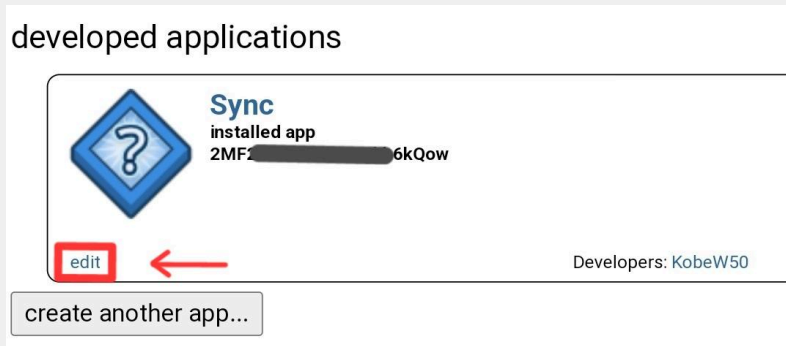

Import the settings backup into your patched Reddit client app (if you created a backup earlier).

Done!

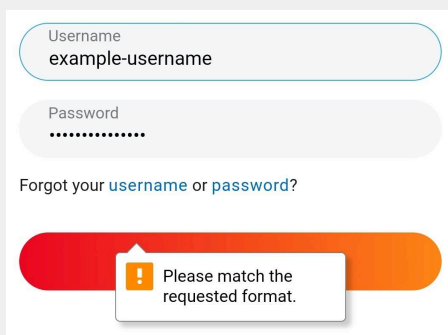

(If needed, you can ask for assistance in the [ReVanced Discord](#), [Subreddit](#), or [Telegram](#).)

Multiple Users

If you want to add multiple accounts to your patched app, go back to [this page](#) and edit the developed application. Then add your other username as a developer and **press Enter on the keyboard**. Then press the update button.

Basic Troubleshooting

If you get the error pictured above, enter in your credentials manually instead of pasting or auto-entering it.

Other errors when signing in

This usually means that something is wrong with your client ID configuration. Here are some common mistakes:

If you are certain that you do not have any of the issues below, create a new client ID and try again from scratch.

- A) The redirect URI is not EXACTLY as shown (maybe it has an extra "/", a capital letter, or you put "https" instead of "http" or vice versa.)
- B) The app type is not set to "Installed app".
- C) You accidentally added an extra space when entering the client ID in the Manager.
- D) The redirect URI is set for a different application. (Example: it is set to "http://redditsync/auth" even though the client ID will be used for an app other than Sync.)
